

# The Large Synoptic Survey Telescope

Lucianne Walkowicz  
The Adler Planetarium

Director, LSSTC Data Science Fellowship Program  
LSST Science Collaboration Coordinator  
Member, LSST Science Advisory Committee

# What is the LSST?

A survey of 37 billion objects in space and time

# What is the LSST?

A survey of 37 billion objects in space and time

*An optical/near-IR survey of half the sky  
in ugrizy bands to  $r \sim 27.5$  (36 nJy) based  
on  $\sim 825$  visits over a 10-year period*

## Dark Energy (DESC):

*Rachel Bean (Cornell); Jeffrey Newman (Pitt)*

Why do the LSST  
Science Collaborations exist?

Collaborations played big role in making  
the science case for LSST

Now they help lay ground work for  
making the best use of LSST

# Telescope Site

Atmospheric limited seeing ( $0.7''$  in  $r$ )

# System Requirements

Light bucket  
(go faint, short exposures)

Agile

Large Field-of-View

Excellent image quality  
(weak lensing)

Fast Readout

Sophisticated Software  
(20 TB/night, ~30 trillion measurements)

8.4m mirror  
(6.7m effective)

5 sec slew+settle

# Observing Strategy (For Now)

## Main Survey 90% of time

18,000 sq deg to uniform depth over 10 years

Visit: two 15 sec consecutive exposures

Same pointing revisit within 1 hour

## Mini Surveys 10% of time

Continuous 15 sec exposures over ~1 hr/night

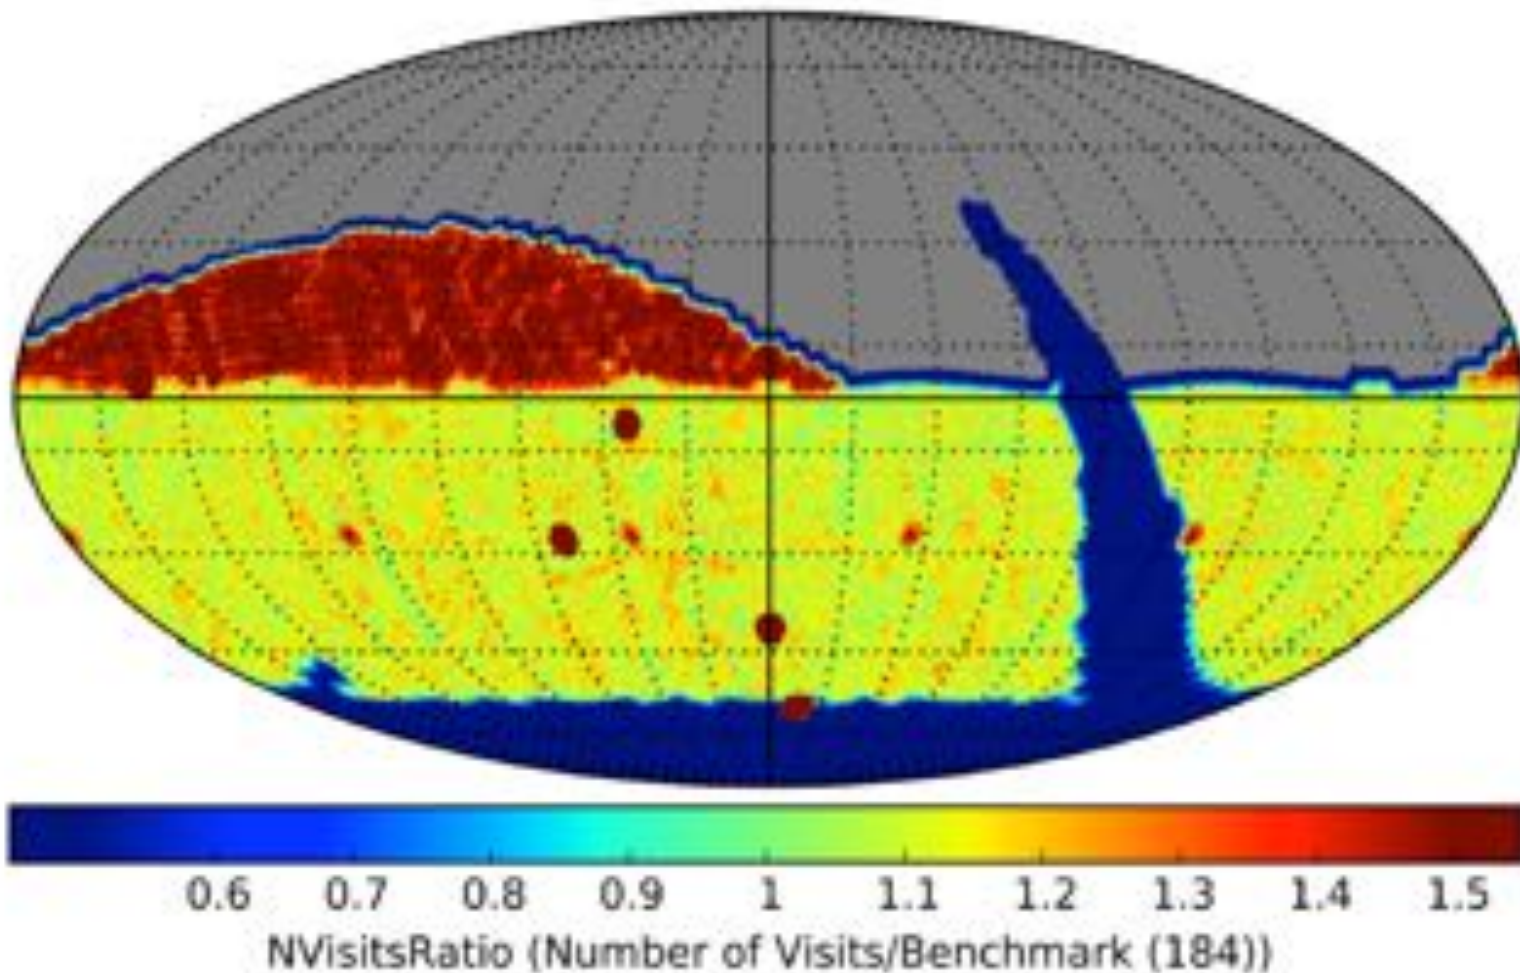

~30 selected fields (300 sq deg)

## Example simulation: 1.7ppm of the survey

# Studying observing strategy with simulations

# Science-Driven Optimization of the LSST Observing Strategy

A community white paper about LSST survey strategy ("cadence"), with quantifications via the Metric Analysis Framework. We are drafting some individual science cases, that are either very important, and somehow stress the observing strategy, and describing how we expect them to be sensitive to LSST observing strategy. MAF metric calculations are then being designed and implemented - we started this during the 2015 LSST Observing Strategy Workshop (in Bremerton, WA, August 17-21): these will form the quantitative backbone of the document. You may have heard of the coming "Cadence Wars" - this document represents the Cadence Diplomacy that will allow us, as a community, to avoid, or at least manage, that conflict. We welcome contributions from all around the LSST Science community.

- [Read the current draft of the white paper](#) (automatically generated PDF, updated every hour, in principle - [log file is here](#)) build passing
- [Join the conversation about this project at its issues list](#)
- [Gauge the project's activity level](#)
- [Suggest a new OpSim experiment](#)
- [Suggest some interesting commissioning observations](#)

## Shortcuts

# Computing

*The computing cluster at the LSST Archive at NCSA will run the processing pipelines.*

- Single-user, single-application data center
- Commodity computing clusters.
- Distributed file system for scaling and hierarchical storage
- Local-attached, shared-nothing storage when high bandwidth needed

**Long Haul Networks** to transport data from Chile to the U.S.

- 2x100 Gbps from Summit to La Serena (new fiber)
- 2x40 Gbps for La Serena to Champaign, IL (path diverse, existing fiber)

# The LSST Science Book contains a wealth of science cases

# What will LSST provide?

Alert generation (60 sec)

Forced photometry ( $\sim 1$  day)

automatic on all new sources  
on request for limited coordinates

Limited alert subscription/filtering

small # of alerts per pointing  
very basic criteria - no classification

# Alert Firehose Support

LSST computing is sized for 10M alerts/night (average),  
10k/visit (average), 40k/visit (peak)

Dedicated networking for moving  
data from Chile to the US

Dedicated image processing clusters  
New image differencing pipelines  
with improved algorithms

# Alert Packets Contain Useful Information

position

flux, size, and shape

light curves in all bands  
(up to a  $\sim$ year; stretch: all)

variability characterization  
(e.g. low-order light-curve moments,  
probability the object is variable)  
cut-outs centered on the object  
(template, difference image)

Discovery  $\neq$  Characterization  $\neq$  Classification

Something's  
Happening

How it's  
Happening

Why it's  
Happening

While LSST doesn't provide *classification*, it does provide the means to *characterize*

- Nightly products (real time)
- Aggregate products (data releases)
- Contextual information (neighbors, cross-catalogs)

# Classification/Characterization

```
# Keep only never-before-seen events within two
# effective radii of a galaxy. This is for illustration
# only; the exact methods/members/APIs may change.
def filter(alert):
    if len(alert.sources) > 1:
        return False
    nn = alert.diaobject.nearest_neighbors[0]
    if not nn.flags.GALAXY:
        return False
    return nn.dist < 2. * nn.Re
```

No cross-match or classification  
Intended for simple user-defined filtering

Sophisticated event brokers/classifiers  
to be developed by the community

# Spectroscopic Follow-up Resources

# Multimessenger Co-observing

Multiple wavebands provide SED constraints

e.g. radio (SKA), GW (LIGO), X-ray (LOFT, eROSITA), IR (Euclid)

Multiple potential contexts:

Main survey, ToO, Deep Drilling Fields

***Logistical issues require forethought***

Programmatic: Target Updates

Data access/ information sharing

Large scale collaboration/communication

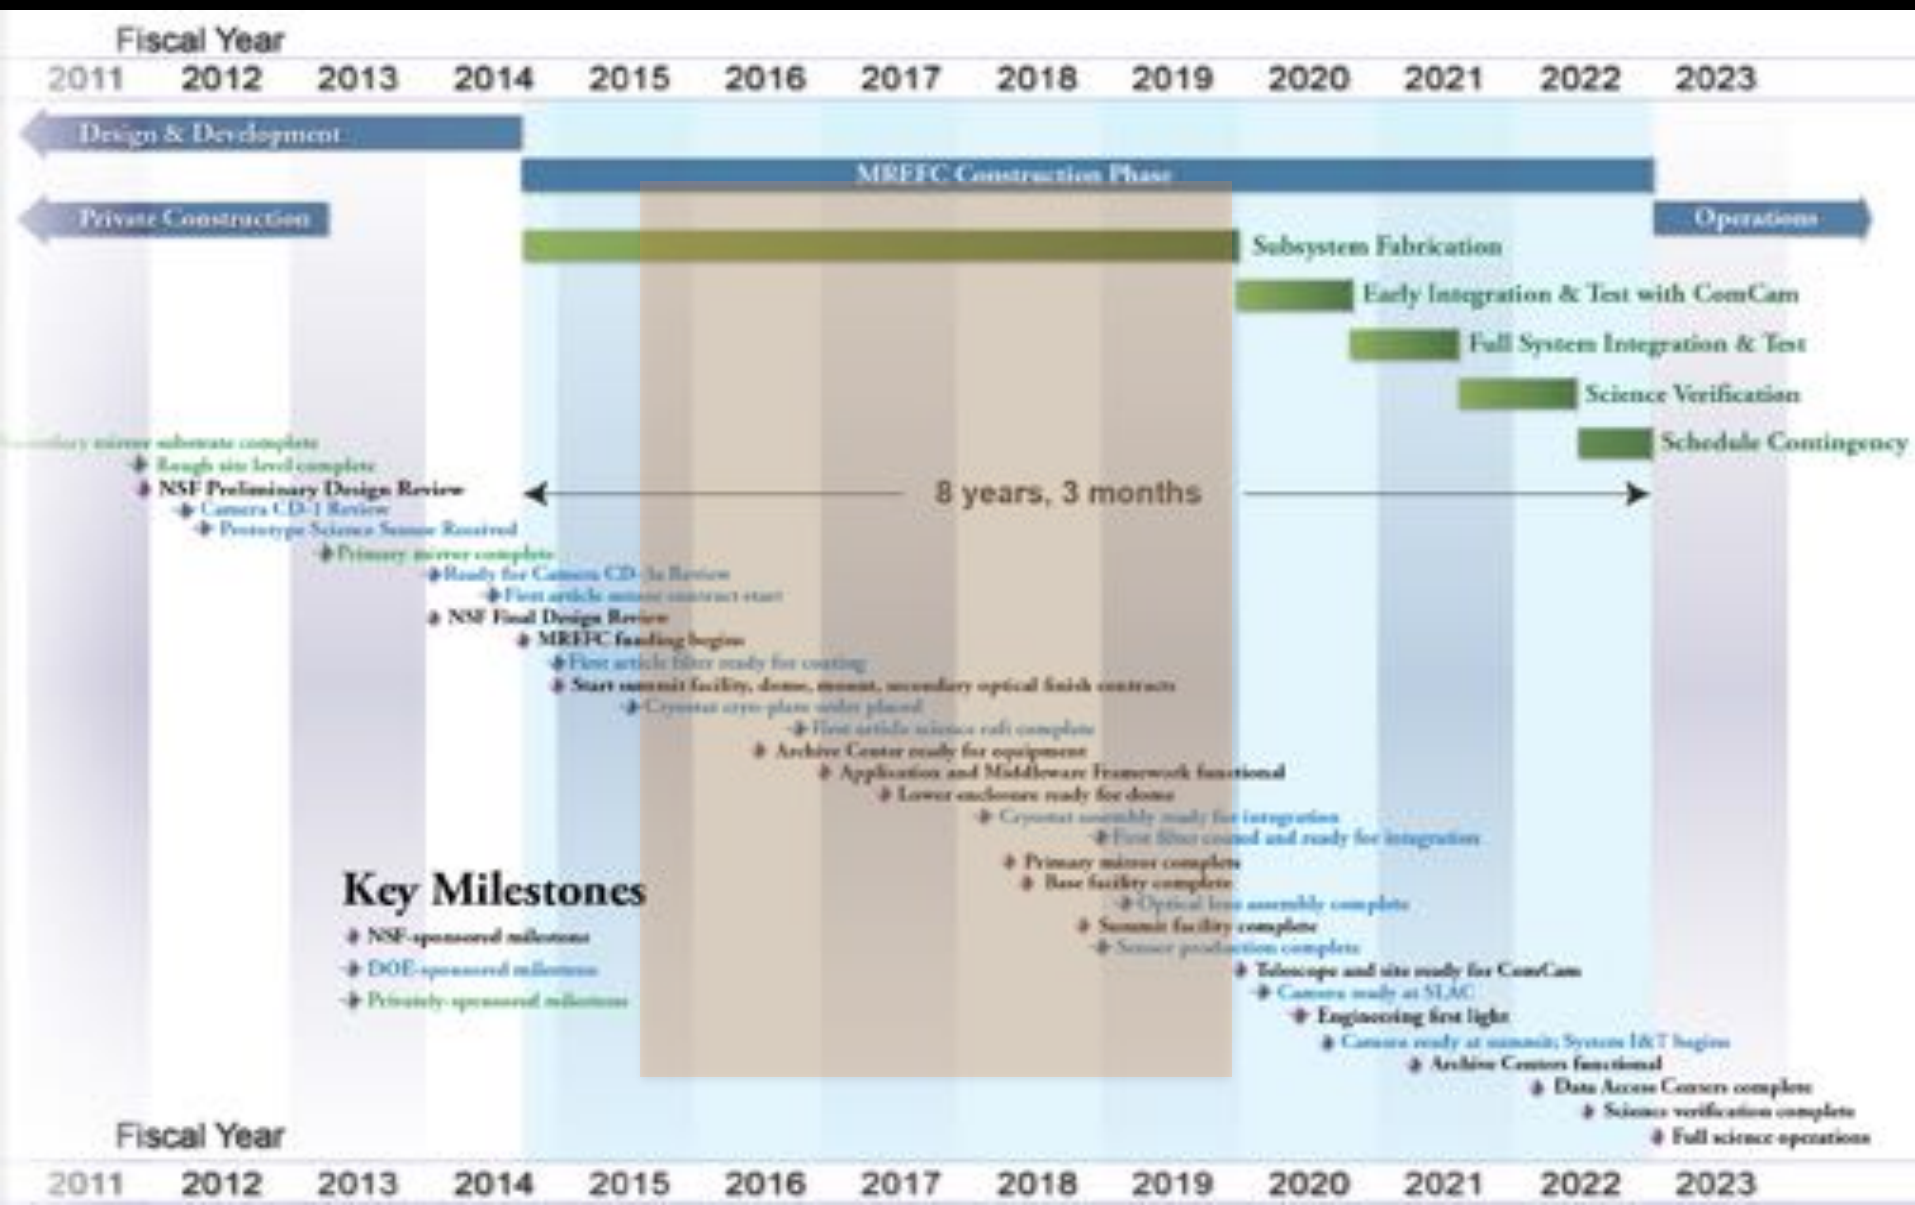

# Synergy between a-LIGO / LSST

LSST field-of-view well-matched to  
localize LIGO events

# Project Timeline

**LST**  **2014**  
  
**CONSTRUCTION START**

# Primera Piedra

Thanks!
